

AQUATECH PARTS BULLETIN

Part number A110850 accumulator was used from time to time by the old Aquatech Company to dampen the pulsation created by the triplex water pumps. Found mostly on the SJ600E trailer units, it was also used occasionally on truck mounted units. This accumulator has become difficult to acquire on a timely basis, so we decided to find something more readily available. In reviewing the specifications with our engineering department, they informed us that the A110850 accumulator is somewhat undersized for the applications where it is used and so we decided to use this opportunity to improve what we offer. As a result we have gone to a larger capacity accumulator and assigned to it part number A110850-1.

Retrofitting the original accumulator will require re-plumbing the pipe tee from ½"NPT branch port to 1"NPT branch port or install a 1" to ½" pipe reducer (part number A381798). The reducer will not affect the performance of the larger accumulator because the hole through the adapter is larger than the hole in the accumulator. The new accumulator naturally is more expensive but it will do a much better job in smoothing the flow at the nozzle.

Part No. A110850
10GPM, 2500PSI, ½"MNPT

Part No. A110850-1
40GPM, 3000PSI, 1"NPT

NOTE: Accumulator is charged with nitrogen prior to shipment and cannot be shipped by air freight.

A381798 3000PSI 1" to ½"NPT Reducer
